

ALLIGATION 2 MIXTURE

Ex - 3

Pg 1.19

Q1 In what ratio must rice ₹ 69 per Kg be mixed with rice ₹ 100 per Kg so that the mixture be worth ₹ 80 per Kg?

Solution

∴ Ratio is 20 : 11

Q2 The average salary per head of the entire staff of a small factory including the supervisor and labourers is ₹ 5750. The average salary per head of the supervisor is ₹ 20,000 and that of the labourers is ₹ 5000. Find the number of labourers in the factory if there are 4 supervisors

Solution

Mo. of Supervisors = 4

Let the number of labourers be y
Average salary of supervisor & labourers = 5750

Salary of 1 labourer = 5000

Salary of 1 Supervisor = 20,000

$$\frac{\text{Sum of terms}}{\text{Total terms}} = \text{Average}$$

$$\frac{4 \times 20,000 + 5000y}{4 + y} = 5750$$

$$5000 [4 \times 4 + y] = 5750 (4 + y)$$

$$20 [16 + y] = 23 (4 + y)$$

$$320 + 20y = 92 + 23y$$

$$320 - 92 = 23y - 20y$$

$$228 = 3y$$

$$76 = \frac{228}{3} = y$$

No. of labours = 76

Q3 A container contains 70.l of orange squash. The squash being too concentrated, 7.l of squash was taken out from this container and replaced by water. This process was repeated thrice to reduce the concentration of squash. How much quantity of orange squash is left in the container.

Solution

Total orange squash = 70.l = x

Squash taken out = 7.l = y

No. of times process repeated = 3 = n

Orange squash is left = $x \left(1 - \frac{y}{x}\right)^n$

Q5 A shopkeeper has 1 quintal of wheat, part of which she sells at 18% gain and the rest at 28% gain. In total she gains 24%. Find the quantity of wheat sold at 18% and 28%.

Solution

I	II
18%	28%

24%

4% : 6%

2 : 3

$$\text{Wheat sold at 18\%} = \frac{2}{5} \times 100$$

$$= 40 \text{ Kg}$$

$$\text{Wheat sold at 28\%} = \frac{3}{5} \times 100$$

$$= 60 \text{ Kg}$$

Q6 600gm of jaggery syrup has 40% jaggery in it. How much jaggery should be added to make it 50% in the syrup?

Solution

$$\text{Total jaggery} = 600 \text{ gm}$$

$$\text{Syrup} = 40\%$$

$$\text{Syrup} = 40\% \text{ of } 600$$

$$= \frac{40}{100} \times 600 = 240$$

240g of jaggery is present in
600 gm syrup

$$\frac{240+x}{600+x} = \frac{1}{2}$$

$$2(240+x) = 600+x$$

$$480 + 2x = 600 + x$$

$$2x - x = 600 - 480$$

$$x = 120$$

Q7 In what ratio, water must be added to dilute honey costing ₹ 240/litre so that resultant syrup would be worth ₹ 200 per l?

Solution

Value of water is taken as zero

Therefore required ratio 40:200
4:20
1:5

88

A container has 50l of juice in it, 5l juice is taken out and is replaced by 5l of water. This process is repeated 4 more times. What is the amount of juice in the container after final replacement?

Solution

$$\text{Total juice} = 50\text{l}$$

$$\text{Juice taken out} = 5\text{l}$$

$$\text{No. of times process repeated} = 5$$

Juice is replaced with water

$$\begin{aligned} \text{Juice is contained by the container} \\ = x \left(1 - \frac{y}{x}\right)^n \text{ unit} \end{aligned}$$

where x is the total quantity,
 y is the quantity removed,
 n is number of times operation repeated.

$$= 50 \left(1 - \frac{5}{50}\right)^5$$

$$= 50 \times \left(\frac{45}{50}\right)^5$$

$$= 50 \times \left(\frac{9}{10}\right)^5$$

$$= 50 \times \frac{9 \times 9 \times 9 \times 9 \times 9}{100 \times 100 \times 10}$$

$$= 29.5 \text{ l}$$
